

Print-on-Demand Solutions

Solution #106

Manufacturing Firm (Erie, PA)

In-plant print shop produces documents for production as well as other material for training and marketing. DocXpress repository used for additional services.

Mainframe order files

This custom module was created to facilitate the automatic importing of orders from a mainframe legacy system. The legacy system outputs printed reports containing manufacturing print requests for future product shipments. The module parses these reports and imports these order files on a continuous basis.

The module verifies the accuracy of the request by verifying the document identifier and revision date of the requested document, with the system repository in DocXpress. Various conditions can arise and these are reflected in the print order added to DocXpress by displaying the order in the open order view in various coded colors. This allows a print operator to determine the nature of the issue and resolve it prior to production.

Author submission via the web

Extensive use of templates on this customer's DocXpress web site ensures accuracy of submission and greatly speeds up document submission.

The submitting authors manage the document status, as they can add, update or remove documents under their control through the use of the web interface.

This particular DocXpress repository is additionally used for fax-on-demand, web viewing, document storage. The same author submission process is used, but choices are made during the submission that determines whether a document is for printing, fax-on-demand or other uses.
